

Unearthing The Environment Impact Of Human Activity : A Global CO2 Emission Analysis

1,Introduction:

Global warming is one of the biggest challenges currently being faced by the human race, although correlation is not causation, a likely cause of global warming is due to increased atmospheric carbon dioxide from human activities

CO2 Emission refers to the Carbon Dioxide emitted throughout the world.

Fossil fuel use is the primary source of CO2. The data throws light onto how much fossil fuels are burnt, per year per nation, which amounts to an increase in CO2 every year. This will help researchers and environment experts to predict global warming. So countries should set a goal to decrease this amount yearly.

1.1-Overview :

Despite the decline in 2020,global energy-related co2 emissions remained at 31.5Gt,which contributed to Co2 reaching its highest ever average annual concentration in the atmosphere of 412.5 parts per million in 2020-around 50% higher than when the industrial revolution begun

1.2-purpose:

Analysis global CO2 emission across countries from 1975 to 2020. This dataset contains a record of CO2 emission by each country and region of earth, here are going to analyse and visualise country wise, region wise and overall CO2 emission on earth.

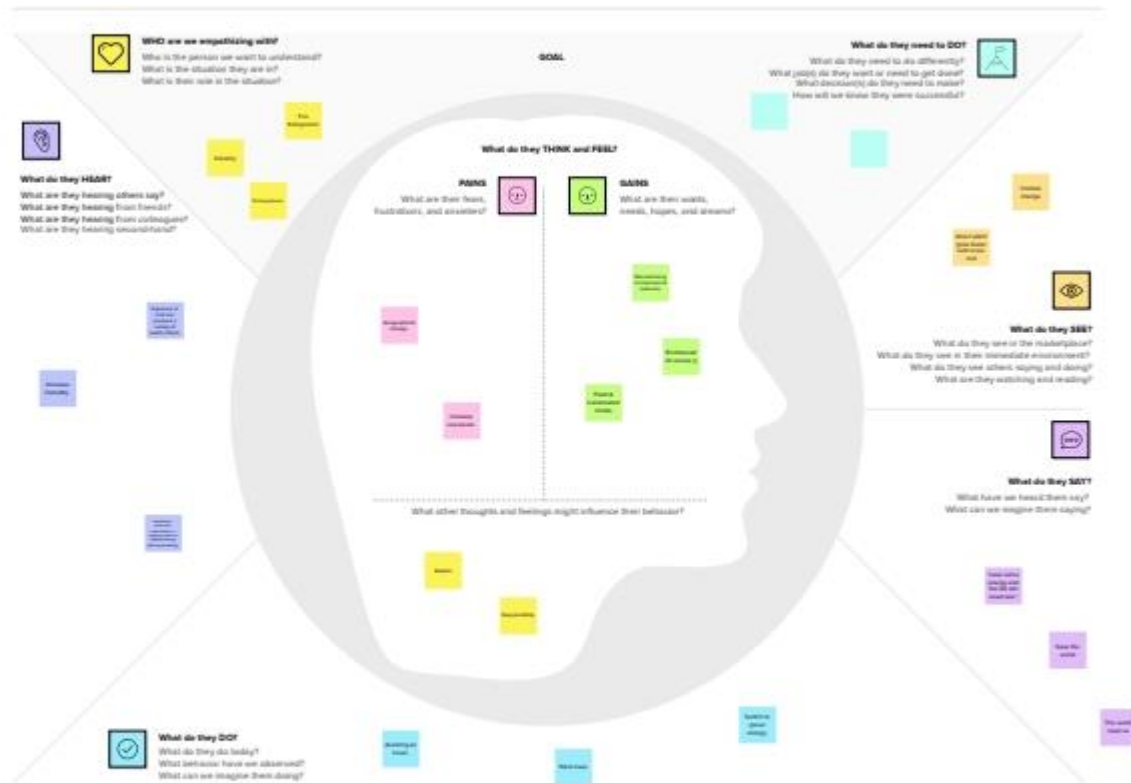

2.Problem Definition & Design Thinking

To start, the problem definition involves analyzing the impact of human activity on global CO2 emissions. This is a complex problem that requires a multifaceted approach, including data collection, analysis, and interpretation. One approach is to use design thinking, which involves empathizing with the users or stakeholders affected by the problem and brainstorming innovative solutions based on their needs. In this case, the users could be scientists, policymakers, or the general public who are interested in understanding the impact of human activity on the environment.

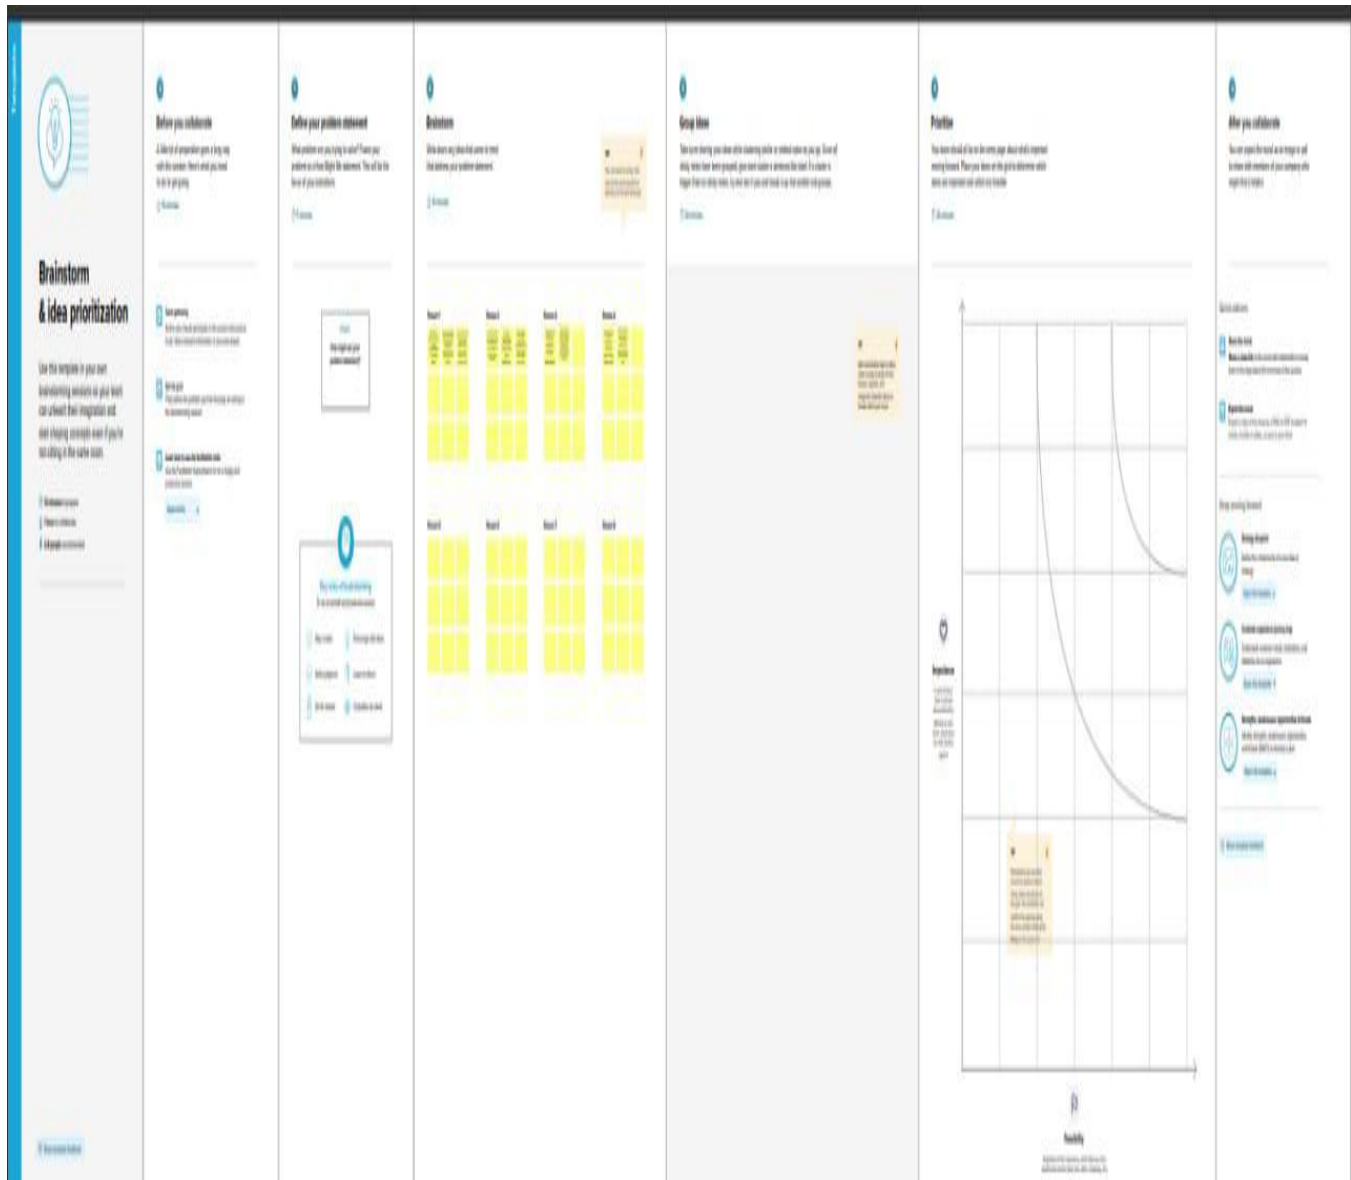

2.1-Empathy Map

Develop shared understanding and empathy

Summarize the data you have gathered related to the people that are impacted by your work. It will help you generate ideas, prioritize features, or discuss decisions.

2.2-Ideation & Brain Storming Map

3. Result

3.1-Data collection & Extraction from database

For the project the data was collected from Kaggle(www.kaggle.com). Data collection is the process of gathering and measuring information on variables of interest,

in an established systematic fashion that enables one to answer stated research questions, test hypotheses, and evaluate outcomes and generate insights from the data.

Dataset consists CO2 emissions in metric ton per capita of every country around the world. The data is collected from 1975 to 2020. In this dataset Countries and regions are included. Data is initially pre-processed using.

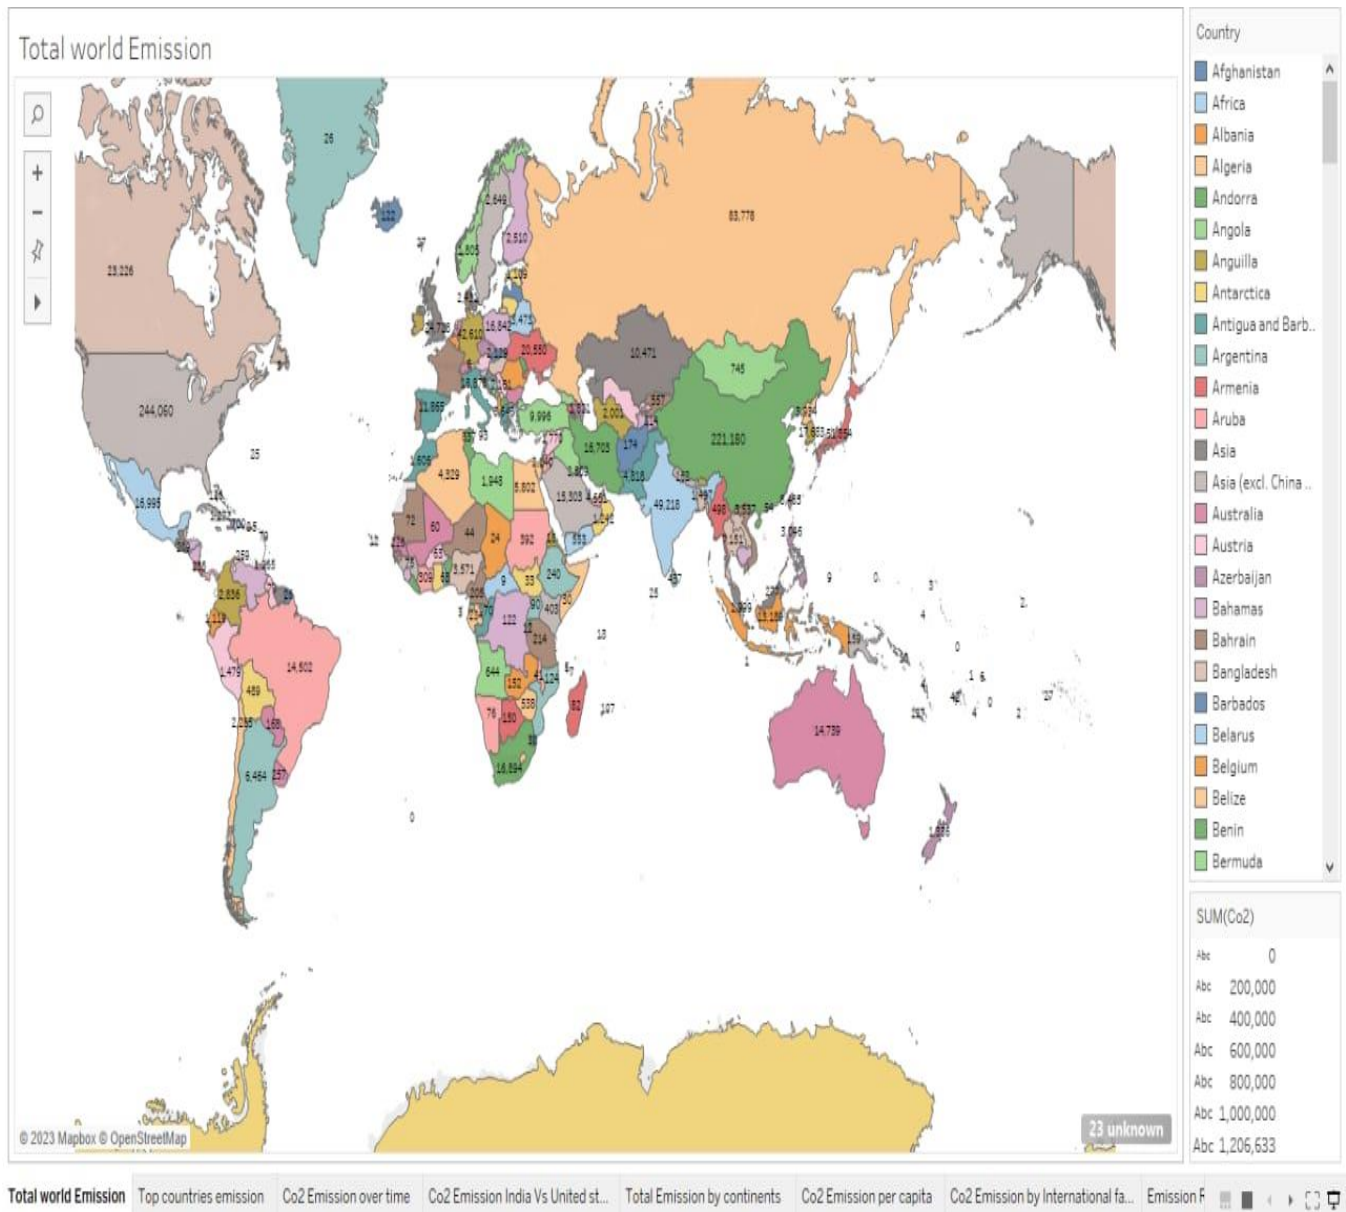

The dataset contains

- Country- Country for which Co2 is Recorded
- Year- Year the data was recorded
- Co2 Emission (In Million Metric Tons)
- Co2 Growth per Capita
- Co2 Per Capita
- Cumulative Co2
- Several Fossil Fuels rate of Emission

3.2 Data Visualization

Data visualization is the process of creating graphical representations of data in order to help people understand and explore the information. The goal of data visualization is to make complex data sets more accessible, intuitive, and easier to interpret. By using visual elements such as charts, graphs, and maps, data visualizations can help people quickly identify patterns, trends, and outliers in the data. Some common types of visualizations that can be used to analyze the Co2 Emission include bar charts, line charts, Tree Map, scatter plots, pie charts, Maps etc. These visualizations can be used to compare performance, track changes over time, show Emission, and relationships between variables, breakdown of factors and emission by countries and continents.

3.2.16 Co2 Emission from 1990 to 2020 based on internal factors

3.3 Dashboard

A dashboard is a graphical user interface (GUI) that displays information and data in an organized, easy-to-read format. Dashboards are often used to provide real-time monitoring and analysis of data, and are typically designed for a specific purpose or use case.

ABOUT US

36°C Mostly sunny

3:12 AM 4/22/2023

1.

4. ADVANTAGES & DISADVANTAGES

Advantages of CO2 Emissions:

1. Green plants grow faster with more CO₂. Many also become more drought-resistant because higher CO₂ levels allow plants to use water more efficiently. More abundant vegetation from increased CO₂ is already apparent.
- 2, CO₂ is a naturally occurring gas and is essential for plant growth, which is important for maintaining the balance in the ecosystem.
3. Carbon dioxide is used as a refrigerant, in fire extinguishers, for inflating life rafts and life jackets, blasting coal, foaming rubber and plastics, promoting the growth of plants in greenhouses, immobilizing animals before slaughter, and in carbonated beverages
- 4, .CO₂ emissions are also associated with economic growth, as industries and factories produce CO₂ as a by product of their operation. This can provide employment and economic benefits to a region.
- 5, In some cases, CO₂ emissions can be used to generate electricity and power, which can be a useful source of energy.

Disadvantages of CO2 Emissions:

- 1, High carbon dioxide levels can cause poor air quality and can even extinguish pilot lights on gas-powered appliances
- 2, CO₂ emissions are a major contributor to climate change and global warming, which can have negative impacts on the environment, human health, and the economy.

3,Carbon dioxide in the atmosphere warms the planet, causing climate change. Human activities have raised the atmosphere's carbon dioxide content by 50% in less than 200 years.

4..The continued use of fossil fuels for energy production, which is a major source of CO2 emissions, is unsustainable in the long term and can lead to depletion of resources.

5..Overall, while CO2 emissions have some advantages, it's important to consider the significant negative impacts they can have and work towards reducing them to mitigate the effects of climate change.

5.APPLICATION

I can explain that CO2 emissions from applications refer to the amount of carbon dioxide released into the atmosphere as a result of the energy consumption and activities of various software applications. This is an important topic due to the growing concern about the impact of greenhouse gases on the environment and climate change.

The amount of CO2 emissions from applications can vary depending on factors such as the type of application, the size of the data centers that run the application, and the type of energy sources used to power those data centers. For example, applications that require significant processing power and data storage may consume more energy and have a higher carbon footprint compared to simpler applications.

To reduce the CO2 emissions from applications, developers and users can take steps such as optimizing code and reducing energy consumption, using renewable energy sources, and practicing sustainable digital habits such as reducing unnecessary data storage and turning off devices when not in use.

6.CONCLUSION

Carbon dioxide is one of the major causes of climate change. There are several harmful effects of carbon dioxide on humans, animals, and plants. Reducing human activities that release carbon dioxide into the atmosphere will reduce the effects of global warming. Global warming is a major concern for the coming years.

7.FUTURE SCOPE:

No climate policies:

projected future emissions if no climate policies were implemented; this would result in an estimated 4.1 to 4.8°C warming by 2100 (relative to pre-industrial temperatures);

Current climate policies:

projected warming of 2.8 to 3.2°C by 2100 based on current implemented climate policies;

National pledges:

if all countries achieve their current targets/pledges set within the Paris climate agreement, it's estimated average warming by 2100 will be 2.5 to 2.8°C. This will go well beyond the overall target of the Paris Agreement to keep warming "well below 2°C".

2°C consistent:

there are a range of emissions pathways that would be compatible with limiting average warming to 2°C by 2100. This would require a significant increase in ambition of the current pledges within the Paris Agreement.

<h2>About Us</h2>

</div>

<div class="row content">

<div class="col-lg-6">

<p>

Carbon dioxide emissions are those stemming from the burning of fossil fuels and manufacture of cement. they include carbon dioxide produced during consumption of solid, liquid, and gas fuels and gas flaring.

</p>

Global carbon dioxide (CO₂) emissions from fossil fuels and industry have increased considerably since 2000, and in 2019 reached a record high of 36.7 billion metric tons of CO₂.

In 2020, the COVID-19 pandemic caused global CO₂ Emissions to plummet five percent to 34.81 billion metric tons.

</div>

<div class="col-lg-6 pt-4 pt-lg-0">

<p>

Historically, Major Global event cause emission reductions. The 2009 global recession caused worldwide Co2 emissions to fall by approximately 460 million metric tons. but this pales in comparison to the emission reduction in 2020. countries around the world were put under strict lockdowns, means transportation and Industrial activities were significantly reduced. Co2 emission levels in india dropped for the first time in four decades in the year ending march 2020. Global Co2 emissions per capita also experienced a substantial decline in 2020 falling to an average of 4.47 metric tons per person.
